Abstract of JP11302438

PROBLEM TO BE SOLVED: To prepare a high-strength, hydrophilic, poly(vinylidene fluoride) film which does not contain any eluted component, has a good hydrophilicity and possesses a high mechanical strength and dimensional stability. **SOLUTION:** A hydrophobic, porous poly(vinylidene fluoride) film is wetted in a solvent, then brought into contact with a solution containing polyvinyl pyrrolidone and a polymerization initiator or with a solution wherein polyvinyl pyrrolidone and a polymerization initiator are dissolved in a wettable solvent, and, with the wetted state maintained and under a temperature condition of 120 deg.C or higher, exposed for a time sufficient for the polyvinyl pyrrolidone to crosslink and become water-insoluble, to impart hydrophilicity to and improve the mechanical strength of the film to obtain a high-strength, hydrophilic, porous poly(vinylidene fluoride) film.
